Digital Bass

Digital synthesis has many advantages, despite what the analogue purists say, and especially when it comes to bass: rock hard attacks, weird harmonic structures that can poke through a mix and total output level reliability for mixes and, in particular, dancefloors. Using the excellent emulations of some classic digital synths from Arturia a set of bass instruments has been built up to provide 72 bassline loops and 12 multisamples. The bass synths were given some extra punch, width and presence with EQ such as the UAD API 550/560 and Soundtoys' SieQ, the Ozone 8 Imager, Eventide Instant Phaser, the Neutron 2 Transient Shaper, and compression from the UAD dbx160, Distressor, Fatso Sr and LA2A (silver). The synths used were the CMI V (Fairlight), Synclavier, Prophet VS, CZ V and DX7 V all of which sound stellar and provide distinct sonic characteristics. As a fan of the Casio CZ-101 the CZ V is a dream to work with, whilst the CMI and Synclavier have taken a little time to become regular go-to synths which can take you places no other instrument can. Using your own samples in those two is worth exploring to get unique flavours that don't come out of more modern, advanced software samplers.

For bass synths get some digital in your life.

The instruments are included as multisamples which run from C1 to C6 and, where necessary, have their sustain loop points embedded into the WAV file for easy transportation into samplers. A set of SFZ files are also included to save any manually key mapping. All multisamples are run with four even spaced notes per octave (C, D#, F# and A).

Stuff Used

Arturia V Collection synths
UAD plugins
Eventide plugins
Soundtoys plugins
iZotope Ozone 8 & Neutron 2 plugins
Steinberg Nuendo 11
